

Technical Specification Installation, Operation, Maintenance and Facility Control Manual

Fitness Facility - Model FMS 60

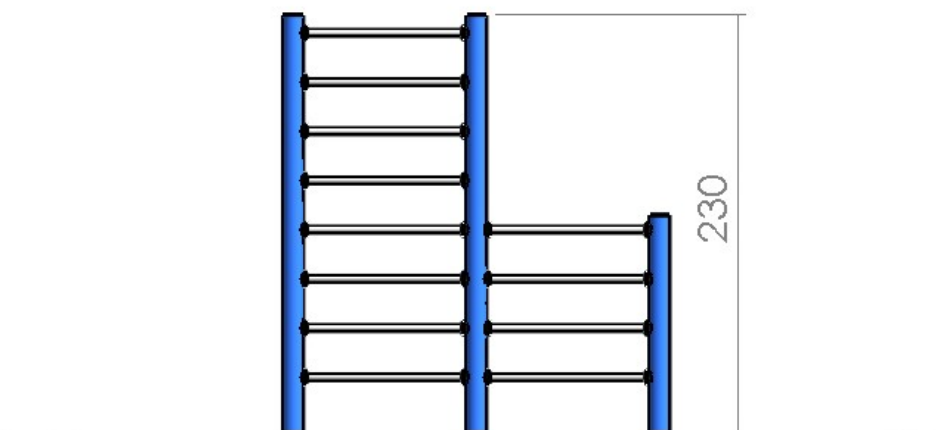

I. TECHNICAL SPECIFICATION

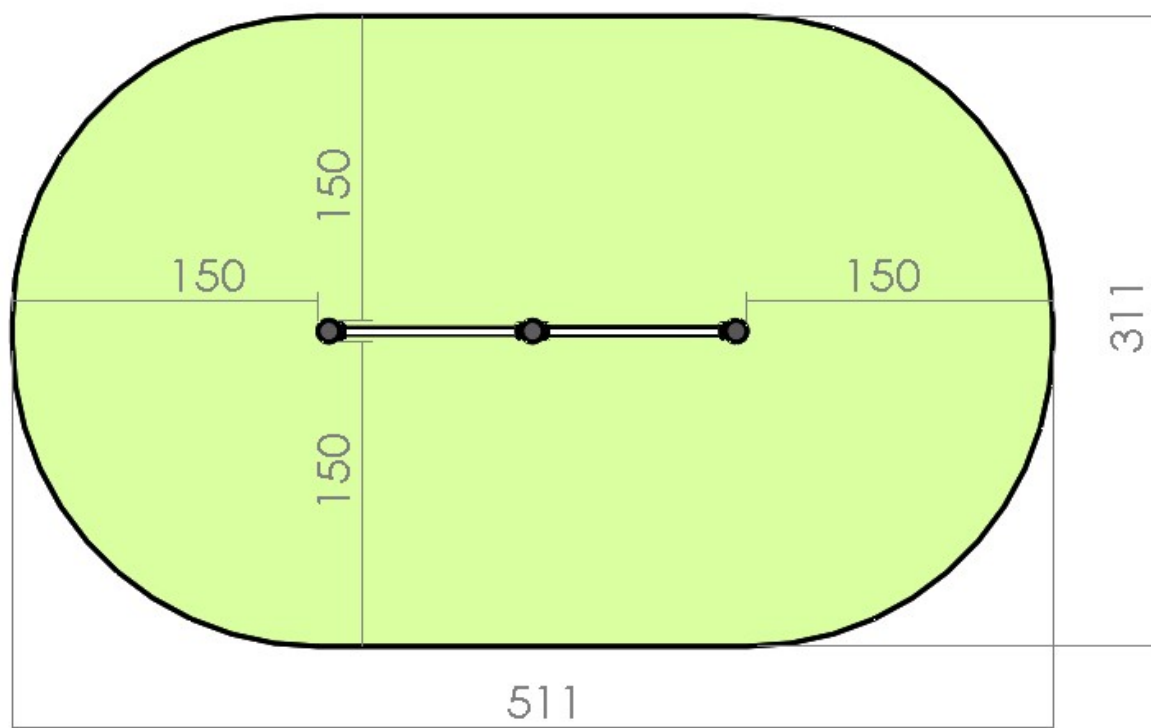

1. General characteristics

Metal wall bars at two levels for outside fitness facilities. They can be used for climbing and stretching, and for the performance of various exercises – pull-ups, legs rising and various other gymnastics exercises. The wall bars are indispensable in the training of balance, flexibility and endurance. This device is widely spared in the training exercises for advanced sportsmen.

2. Overall dimension of the facility and minimum required space for positioning

Зона на падане - 15 м2

3. Used materials

1.) Construction of round metal profiles

The construction of the facility consists of massive metal thick-wall columns. The functional elements are also made of metal pipe profiles. The construction is designed according to the requirements of **BDS EN 16630:2015**, both in terms of consistent and variable loads and number of users per given size-volume and in relation to all requirements of that standard for fall protection and protection against all types of pinches. Two layers of paint are applied over the metal construction after degreasing and rust cleaning, with special paints with anti-corrosion ingredients and very high UV and scratching resistance. The chemical composition of the coating meets the requirements of **BDS EN 16630:2015**

2.) Polyethylene elements

All polyethylene elements (protective caps, plugs) are made through moulding of high-quality high density polyethylene with addition of required ingredients in order to provide the required plasticity and durability to weathering and UV rays and are fixed to the facility through one-piece connections.

3.) Rubber elements

All rubber elements on the facility are vulcanized over metal bases in order to ensure sufficient robustness and are made of styrene butadiene rubber SDR with hardness shore 80, meeting the requirements for resistance to weathering and UV rays.

4.) Joints

Metal, threaded galvanized fittings with M8, M10 and M12 are used for the assembly of the individual modules and the construction. All bolts' heads and nuts which do not have flat configuration and require special tooling are hidden by special caps.

II. INSTALLATION OF THE FACILITY

The fixation of the facility to concrete foundations is performed through enough in number massive anchoring bolts, with size of M12.

III. GENERAL GUIDELINES FOR MAINTENANCE OF THE FACILITY

In order to ensure the safe operation of the facility it is required to perform periodic control of the moving and stationary functional elements and supporting modules. In case of malfunctions as a result of vandalism, tear and wear or misuse, it is required to take measures for fixing of the issues in order to ensure safe operation of the facility.

IV. WARRANTY PERIOD

The warranty period of the product is 2 (two) years and covers the following defects:

- Defects in the craftsmanship of the product;
- Defects of the materials used during craftsmanship;

The improper operation and damages to the product as result of vandalism void the warranty of the product.
